

Low Vision Glasses Series

New E-Scoop® Glasses from Holland

The E-Scoop® glasses were developed to bridge the gap between standard eyeglasses and spectacle telescope glasses. E-Scoop lenses are placed in front of your standard prescription eyeglasses to assist with the difficulties of night driving, bright lights, sunlight, or cloudy vision.

You may use E-Scoop glasses as you would regular prescription eyeglasses. Day or night, indoors or outdoors, E-Scoop lenses will enhance your visual abilities.

The E-Scoop lens is comprised of five optical properties:

- Custom yellow tint
- Anti-reflection coating
- Special lens thickness
- Special “base curve” of the lens
- Base up or base down prism

When these five optical properties are combined into the E-Scoop lens, the image is enhanced, contrast improves, and the image is shifted to a healthier part of the retina. The result is better vision.
