

San Tan Eye Care is committed to offer all patients the highest standard of care available. A retinal evaluation provides insight into your retinal health and is an essential element of your eye examination. Along with aiding detection of retinal diseases like macular degeneration, retinal detachments and glaucoma, it can also detect ocular effects of systemic disease such as diabetes and high blood pressure. Because of these facts, the doctors at San Tan Eye Care are recommending EITHER a dilated examination or an Optomap on all patients.

DILATION: is a safe and common procedure used every day. It does cause sensitivity to light and may blur your near vision for 3-5 hours.

OPTOMAP: gives us the doctor the ability to track and compare images from previous exams. It is fast and non-invasive with no after effects because no dilating drops are used. Most vision plans will not provide for this advanced screening test. The fee for the OPTOMAP is only \$39.00.

I understand the doctor recommends these procedures as appropriate for me to have and if I elect to decline both procedures my doctor will not be able to adequately check for the presence of retinal pathology, optic nerve disease or the other anomalies such as those described above.

Please CHECK ONE:

Dilation _____ no charge

Optomap _____ \$39.00

DECLINE BOTH dilation and Optomap _____

Patient name (please print) _____

Responsible party (if minor) _____

Date _____
